Colours graphics in the document

First you have to input packages using `\usepackage{color}` and `\usepackage{graphicx}`. Then read the packages documentation.

This document "Packages in the graphics bundle" serves as a user-manual for the packages `color`, `graphics`, and `graphicx`. Further documentation may be obtained by processing the source (dtx) files of the individual packages.

Package colour

One special option for the `color` package that is of interest is `monochrome`. If this option is selected the colour commands are all disabled so that they do not generate errors, but do not generate colour either. This is useful if previewing with a previewer that can not produce colour.

Defining colours

The colours `black`, `white`, `red`, `green`, `blue`, `cyan`, `magenta`, `yellow` should be predefined, but should you wish to mix your own colours use the `\definecolor` command.

```
\definecolor{light-blue}{rgb}{0.8,0.85,1}  
\definecolor{mygrey}{gray}{0.75}
```

To use predefined colour you have to write `\color{name}`. To write text in colour you write `\textcolor{name}{text}`.

Package graphicx

Package `graphicx` is 'extended' `textttgraphics` package.

Usage: `\includegraphics[options]{file.jpg}`. It is possible to use also .pdf and .png files.

As `options` you can write for example: `scale=number`, `rotate=angle`, `width=value`, `height=value`.

Some examples

1. Picture in normal size (here we use option `scale=0.1`).

2. Picture rotated. We use option `angle=45` and `-45`.
